NB-ARC family tree of Lamiaceae NLRs anchored with RefPlantNLR (85 clades)

mposition of tree leaves per clade (share of leaves); Lamiaceae species present (grey scale, 1–46); Lamiaceae genes per clade (log scale, bars). Shaded clades: ≥35 species and ≤3 genes/species on average; darker = median 1 copy per species (single-copy-like), lighter = widespr
cd-hit (85%) representatives with clusters expanded to genes. Root: between the TNL/RNL clade (C18, with the Klebsormidium sequence) and the CNL clades.
